

Used Parts for Forklifts

Used Forklift Parts - Without doubt, lift truck components will eventually wear out and require replacing. The alternative of purchasing new components could become pricey so another idea is to acquire used parts. This could save a lot of money in the end. It is a good idea to purchase used forklift components that have been reproduced. These components would ensure that you are getting parts which will work for a long time and be productive.

Broken or worn parts which are reproduced are a cheaper solution as opposed to rebuilding. With rebuilding parts, only the components that are broken or worn out get changed, which means that other wearable components could break down soon after acquisition.

Remanufactured components are cleaned after being taken apart and have the unusable parts replaced. This method could offer the best assurance for used components. All wearable parts are replaced regardless of age or wear which is one more reason why reproduced components generally perform so much better. Whatever component within the part is brand new and this offers far longer life to the second-hand part. Based on the lift truck components that are being redone, the cleaning process and the whole remanufacturing process will vary.

After complete disassembly, the engines are oven cleaned. Several parts of the engine like spark plugs, pistons, rings, valve springs, filters, and valves could be replaced during the remanufacture process. The engines are hot tested after reassembly to guarantee that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are disassembled, oven cleaned and pressure washed. A comprehensive examination is done to be able to check for any cracks. Bushings, seals and bearings are all replaced. Usually, the replacement components utilized on transmission parts meet OEM specifications.

Certain components like for example torque converters, the alternator, the water pump, steer axles and the starter can obtain longer serviceability after being remanufactured and having all wearable components replaced. The electronic control in the electric forklift is maintained by the control card. This particular card could even be remanufactured with replacing all aged and worn out components. Not like various forklift components the control card can only have the worn and aged components replaced.

Parts which are remanufactured have to be comprehensively inspected upon reassembly to guarantee they are in good condition before being sold. When purchasing these parts, it is a good idea to be certain that they have undergone all of the proper testing and inspections. On certain larger components like for example steer axles, engines and transmissions, OEM specification replacement components must be used.

The lift truck dealer could ensure that the parts they have remanufactured meet the OEM specifications. This will also guarantee the parts meet industry standards. A lot of details go into remanufacturing second-hand components. This attention to detail offers more serviceability out of remanufactured parts opposed to the parts that were simply rebuilt.
